Table A.4: Estimated difference between list and direct estimates of support for Castro

	International A list	International B list	Statement B list
March 2015	-9% (-19%, 2%)		
March 2021		-22% (-32%, -12%)	
June 2022		-14% (-23%, -6%)	-31% (-41%, -21%)

Note: International A and B lists differ in that A includes Lukashenko in the control list whereas B includes Nazarbaev instead. Both Political item A and B lists use political items instead of political figures in their control lists, but otherwise have wholly different control list items.

As such, the fact that there is a relatively high proportion of respondents at the floor across all list experiments with Putin as a sensitive item (ranging from 19% to 37%) is cause for concern. Two aspects of the experiment ameliorate this concern. First, though the percentage of respondents at the floor can vary substantially between experiments across waves, this variation has no clear relationship with the level of deflation we observe in the lists vis-a-vis the direct questions. Second, the proportion of respondents at the floor does not vary substantially between 2015 and 2021, indicating that the difference in levels of deflation cannot be attributed to variation in floor effects.

In the case of experiments with Navalny as the sensitive item, our concern is ceiling effects. Since revealing support for Navalny is sensitive, then respondents who support all control list items and Navalny may feel compelled to report fewer than four items in the treatment list. This effect could artificially deflate estimated support for Navalny. Luckily, there are relatively few respondents in the ceiling for the lists with Navalny as the sensitive item (Table B.6), minimizing concerns about these effects.

Table B.4: Percentage of control list respondents at floor or ceiling in Putin list experiments

	Contemporary		Historical		International		Statement A	
	% Floor	% Ceiling	% Floor	% Ceiling	% Floor	% Ceiling	% Floor	% Ceiling
2015								
January	33%	12%	26%	7%				
March	36%	16%	35%	5%				
2020-2021								
November	32%	7%	22%	3%				
February			31%	4%				
March	34%	11%	26%	5%				
June	31%	10%			37%	6%		
2022								
June			19%	6%			34%	5%

the value of zero on the horizontal axis. Such a phenomenon would suggest floor effects, since it would be evidence that some proportion of respondents who support no control list figures directly are falsely reporting support for the sensitive item to avoid revealing their lack of support.

Figures B.1-B.3 provide little evidence of floor effects: the dark and light lines run roughly parallel in all figures save for those in Figure B.1. Figure B.1 is the society list with Navalny as a sensitive item; the lines overlap at high values of the horizontal axis because there are exceedingly few respondents at the ceiling (per the direct questions).

Figure B.1: Relationship between direct support for society figures and list responses

Note: Lines estimated using LOESS; dark represents the line for the treatment condition, light the line for the control condition.

Figure B.2: Relationship between direct support for contemporary political figures and list responses

Note: Lines estimated using LOESS; dark represents the line for the treatment condition, light the line for the control condition.

Figure B.3: Relationship between direct support for historical political figures and list responses

Note: Lines estimated using LOESS; dark represents the line for the treatment condition, light the line for the control condition.

Figure B.5 Histogram of responses to contemporary list experiment by experimental condition

Figure B.6: Histogram of responses to international list experiment by experimental condition

Figure B.7: Histogram of responses to statement list experiments by experimental condition (June 2022)

C: Double list experiments

We follow the recommendation of Glynn (2012) to estimate the prevalence of at least one sensitive figure in each wave using double list experiments. In double list experiments, approximately half of the respondents are randomly assigned to the control condition in the first experiment and the treatment condition in the second; the other half are assigned to the treatment condition in the first experiment and the control condition in the second. The sensitive item is the same in both experiments. The prevalence of the sensitive item can then be estimated using the data from both experiments, resulting in substantially more efficient estimates.

For January 2015, March 2015, March 2021, June 2021 and June 2022 we use the double list experiments to estimate the prevalence of the support for Putin; the first three double lists use the contemporary and historical lists, the June 2021 list uses the contemporary and international list, and the June 2022 list uses the historical list and a statement list. The February 2022 double list consists of data from the contemporary and society lists, which we use to estimate the prevalence of support for Navalny. The June 2022 wave also includes a double list experiment on the prevalence of support for Castro (the international list and a statement list).

In addition to estimating the prevalence of the sensitive item, we can also use the double lists to estimate the difference between the list and direct estimates of support for these political figures. To do so, we follow the Blair and Imai (2012) approach of simulating an appropriately large number of draws from the distributions of both the double list and direct estimates of support for these figures, then using the difference between these draws to calculate both the average difference between the estimates and appropriate uncertainty intervals.

Appendix Table C.1 reports results from the double list experiments.

In addition to estimating the difference between direct and list experiment estimates of support for political figures, we use a similar technique to estimate the difference between these differences across time. Specifically, the double list experiments in March 2015 and March 2021 are directly comparable (they consist of the same set of list experiments with the same sensitive figure, Putin). Specifically, we take a sufficiently large number of draws from the distributions of differences in both years, then use these differences to estimate both the average difference and an appropriate uncertainty interval. The estimated difference is 12%, with a 95% CI of (11%, 13%).

In plain English, March 2021 shows a difference between the double list and direct estimates of support for Putin that is 12 percentage points larger than the difference between the double list and direct estimates of support for Putin in March 2015. Furthermore, we can reject the null hypothesis of no difference between March 2021 and 2015 at the $\alpha=.05$ level.

Table C.1: Double list experiment results

	Putin		Navalny		Castro	
	Double list estimate	Direct/List difference	Double list estimate	Direct/List difference	Double list estimate	Direct/List difference
2015						
January	80% (74%, 86%)	-7% (-13%, -0%)				
March	79% (73%, 85%)	-9% (-15%, -3%)				
2021						
February			18% (13%, 23%)	-2% (-7%, 4%)		
March	42% (37%, 47%)	-21% (-27%, -15%)				
June	47% (41%, 52%)	-22% (-28%, -16%)				
2022						
June	59% (53%, 65%)	-25% (-31%, -19%)			32% (26%, 37%)	-23% (-28%, -17%)

Values in parentheses represent 95% confidence intervals about the point estimates.

Appendix Table D.1 tracks patterns of item nonresponse related to directly-reported support for different political figures across survey waves, ordered by rank position in June 2021 as possible, then by position in the temporally most proximate survey wave.

If anything, item nonresponse seems to be linked to the salience of the figure, as opposed to sensitivity. For example, Nelson Mandela and Pavel Grudinin have the highest levels of nonresponse (maximum of 15% and 12%, respectively), whereas both Putin and Navalny have relatively low levels of nonresponse (both with a maximum of 4%). The average level of nonresponse in directly-reported support for Putin is substantively quite similar between 2015 and 2020-2022; while it is slightly higher in 2020-2022, the increase in nonresponse is actually greater for control list figures. These patterns provide no evidence that the sensitivity of support for Putin has increased over time.

E: Russian-language list experiment questions

We use the formulation in Figure E.1 for all political figure lists, changing only the figures on the list. We use the formulation in Figure E.2 for all political statement lists. As the figure illustrates, list items for this formulation vary by experiment.

Figure E.1. Example political figure list experiment.

ПОСМОТРИТЕ НА ЭТОТ СПИСОК ПОЛИТИКОВ И СКАЖИТЕ, ДЕЯТЕЛЬНОСТЬ СКОЛЬКИХ ИЗ ЭТИХ ПОЛИТИКОВ ВЫ В ЦЕЛОМ ОДОБРЯЕТЕ. НЕ НАЗЫВАЙТЕ КОНКРЕТНЫЕ ИМЕНА - ТОЛЬКО ОТМЕТЬТЕ В СТРОКЕ НИЖЕ ЦИФРОЙ ОТ 0 ДО 4 СКОЛЬКО ИЗ ЭТИХ ПОЛИТИКОВ ВЫ В ЦЕЛОМ ОДОБРЯЕТЕ.

Иосиф Сталин
Леонид Брежнев
Борис Ельцин
[Владимир Путин]

Figure E.2. Example statement list experiment with two different lists.

ПОСМОТРИТЕ НА ЭТОТ СПИСОК УТВЕРЖДЕНИЙ И СКАЖИТЕ, СКОЛЬКО ИЗ НИХ ПОДХОДИТ ВАМ ЛИЧНО. НЕ ГОВОРИТЕ МНЕ, КАКИЕ ИМЕННО УТВЕРЖДЕНИЯ ВАМ ПОДХОДЯТ - ТОЛЬКО ОТМЕТЬТЕ В СТРОКЕ НИЖЕ ЦИФРОЙ ОТ 0 ДО 3 СКОЛЬКО ИЗ ЭТИХ УТВЕРЖДЕНИЙ ВАМ ПОДХОДИТ.

Putin list:

Обычно я читаю более одной газеты или журнала в неделю.
Я могу назвать имя Председателя Конституционного Суда РФ.
Я доволен(а) уровнем своего дохода.
[Я поддерживаю деятельность Владимира Путина]

Castro list:

Я могу назвать имя Генерального секретаря ООН.
Я смотрю телевизор, YouTube (Ютуб) или стриминговые сервисы (IVI, ОККО, Кинопоиск и др.) хотя бы раз в неделю.
Я знаю человека, который посещал Кубу.
[Я поддерживаю деятельность Фиделя Кастро.]
